

Therapeutic anticoagulation in the trauma patient: is it safe?

Answer (EN)

The provided excerpt does not answer the safety question. It only describes the study design: an 18-month retrospective review of trauma patients who received therapeutic anticoagulation with unfractionated heparin (UH) and/or fractionated heparin (FH), aimed at determining "(1) the incidence of complications using therapeutic anticoagulation in trauma patients, and (2) if any patient factors are associated with these complications," with "forty different pre-treatment and treatment patient characteristics" recorded (arXiv:SciQ:ctx). No results, complication rates, or conclusion are included in the given source text, so the paper as provided does not state whether therapeutic anticoagulation in trauma patients is safe.
