

Do mutations causing low HDL-C promote increased carotid intima-media thickness?

Answer (EN)

No. In a 1:2 case-control study of sex and age-matched subjects (n=114), carotid intima-media thickness (cIMT) was nearly identical between cases carrying mutations causing low HDL-C (10 different mutations in LCAT, ABCA1 and APOA1) and controls. The paper states these genetic HDL deficiency states "often do not correlate with premature CHD," consistent with cIMT not being increased (arXiv:SciQ:ctx).

中文速览

否。携带 LCAT、ABCA1、APOA1 突变 (10 种) 导致低 HDL-C 的病例, 其颈动脉内膜中层厚度 (cIMT) 与对照组几乎相同, 未见增厚; 遗传性 HDL 缺乏常与过早冠心病无关 (arXiv:SciQ:ctx)。

Source evidence

"In a 1:2 case-control study of sex and age-related subjects (n=114), cIMT was nearly identical between cases and controls."

Final decision: no
