

Is adjustment for reporting heterogeneity necessary in sleep disorders?

Answer (EN)

The provided source does not state a conclusion on whether adjustment for reporting heterogeneity is necessary in sleep disorders. The abstract only describes that the study “evaluates the need for adjusting for reporting heterogeneity in the management of sleep and energy related problems in Japan.” It confirms the research aim—to compare results “before and after adjustment for reporting heterogeneity in self-reports”—but the excerpt contains no reported findings, effect estimates, or verdict on necessity. Therefore, based strictly on this source, the necessity of the adjustment cannot be confirmed or refuted; the source merely establishes that this question was under evaluation.
